

Night Drive

Tokai Night Drive

Tokai Night Drive lenses help to filter glare from light associated with LED & Xenon headlights and improve the contrast of your night vision.

This increases visual comfort and reduces the blinding effect from oncoming vehicles, helping to create a safer night driving environment.

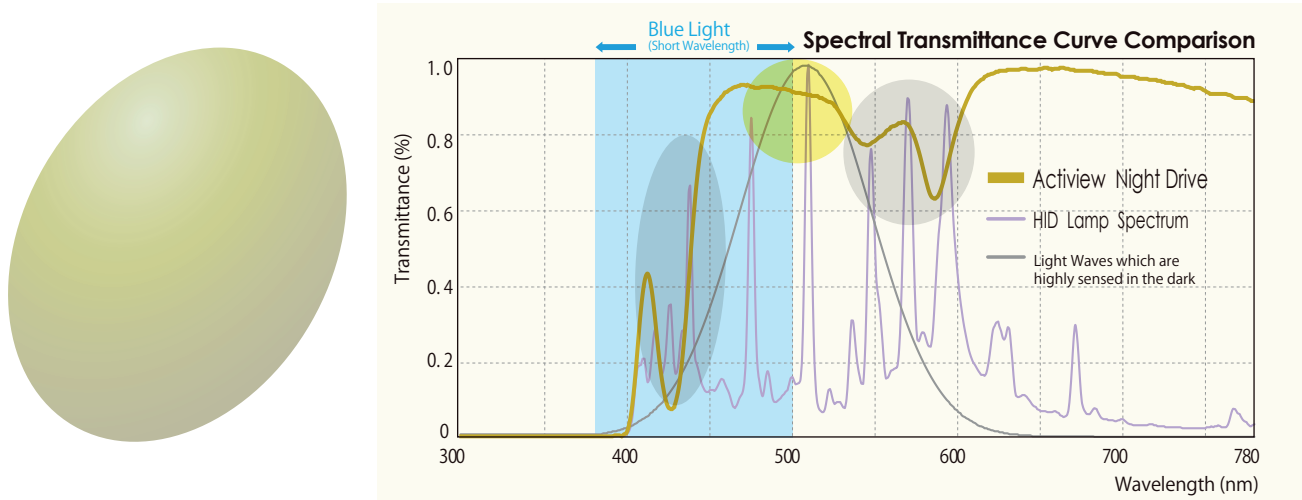

Benefits of Tokai Night Drives medical filter

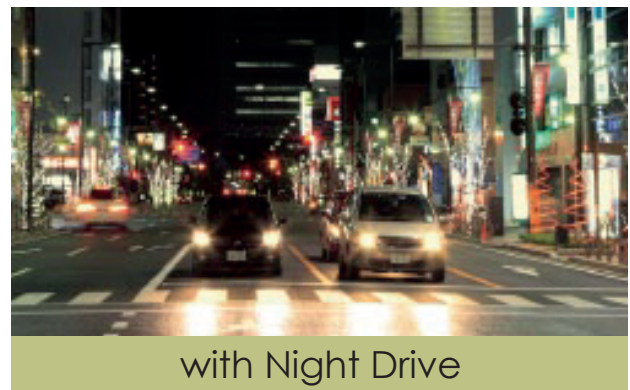

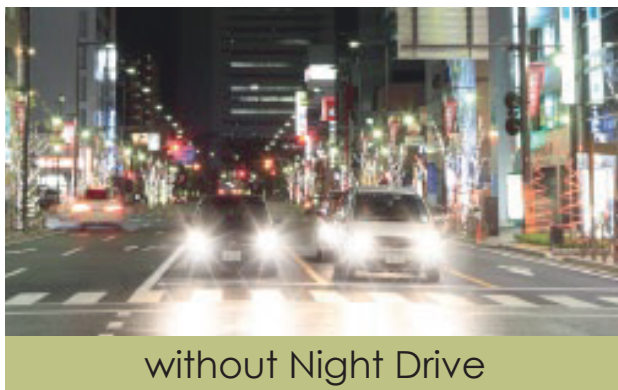

Poorly adjusted headlights or oncoming vehicles with bright blueish headlights create a lot of discomfort.

Tokai Night Drive filters the irritating and sometimes painful glare from LED or Xenon headlights.

The below graphic represents this glare and illustrates the filtering effect of Night Drive.

The medical filter has a dimming effect on glaring light without darkening the overall view. It also increases the contrast, resulting in clearer vision.

The Night Drive medical filter is applied directly in to the lens during the casting process. This ensures that the quality of the result is far superior than when it is applied as an additional film on top of the lens.

Night Drive is a bespoke range of single vision and varifocal designs, all with their own specific materials. Please contact us for more information.
